

# **Maximizing Food Waste Co-Digestion Statewide: Investments Needed and Lessons Learned**

---

**Webinar, October 13, 2020, 9am-10am**

A large, weathered piece of driftwood lies on a sandy beach. The background shows the ocean with gentle waves under a clear sky. The entire image has a blue color overlay.

CAROLLO ENGINEERS

# California's Senate Bill 1383 (SLCP Reduction Implementation): Organic Waste Reduction Timeline

# What does co-digestion look like at a WRRF?

How much capacity do we really have?

How much additional capacity do we need?

What could impact feasibility?

How much food waste can we accommodate?

If it's so great, why isn't everyone already doing it?

How much will it cost to implement?

Could WRRFs generate revenue from it?

How much of an impact will it make?

# Co-Digestion Capacity in California

Six Chapter Report with Appendices

- Finalized June 2019
- Multi-agency review at State level
- Governor's Office approval
- Published August 2020

Co-Digestion Capacity Analysis  
Prepared for the California State Water Resources  
Control Board under Agreement #17-014-240

CO-DIGESTION CAPACITY IN  
CALIFORNIA

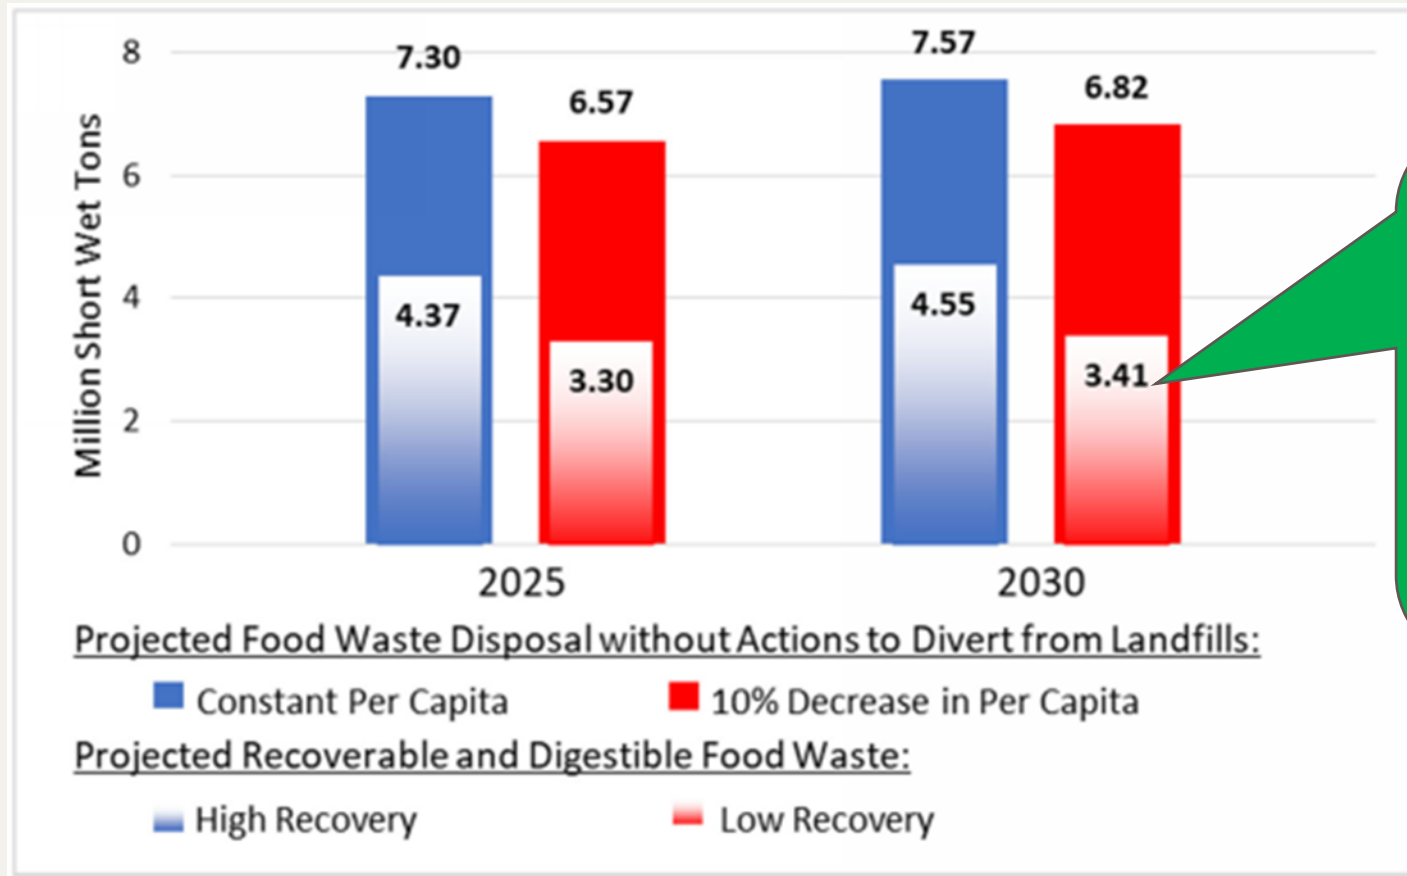

FINAL | June 2019

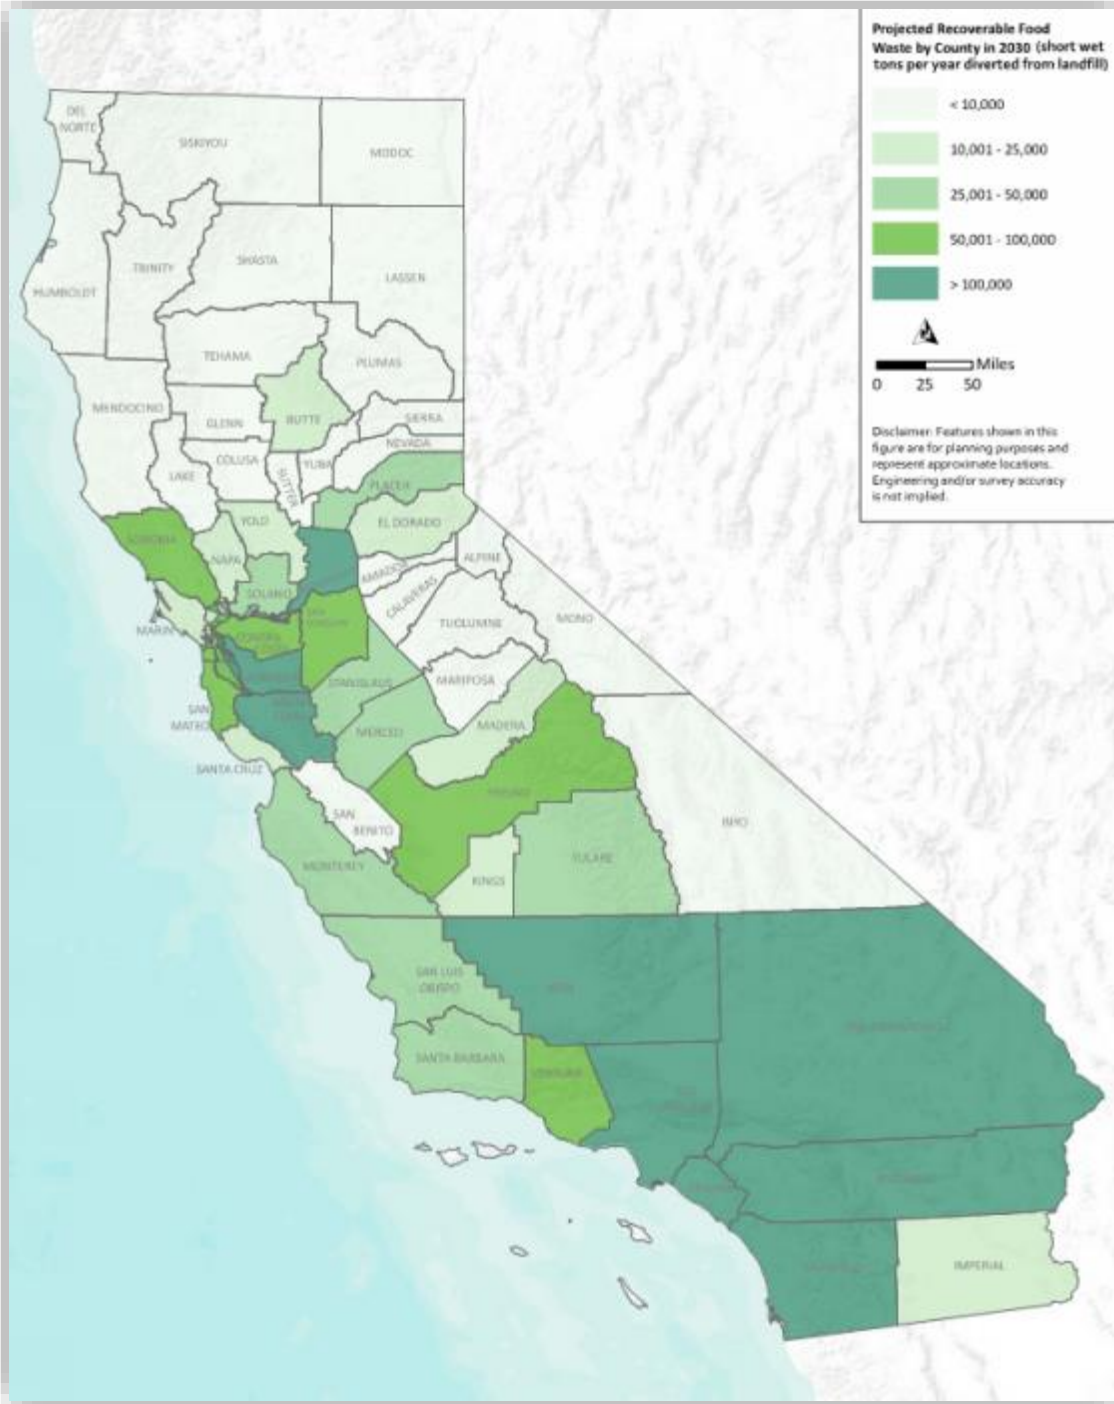

# Chapter 1: Food Waste Disposal Analysis

# How much food waste will there be in CA in 2030?

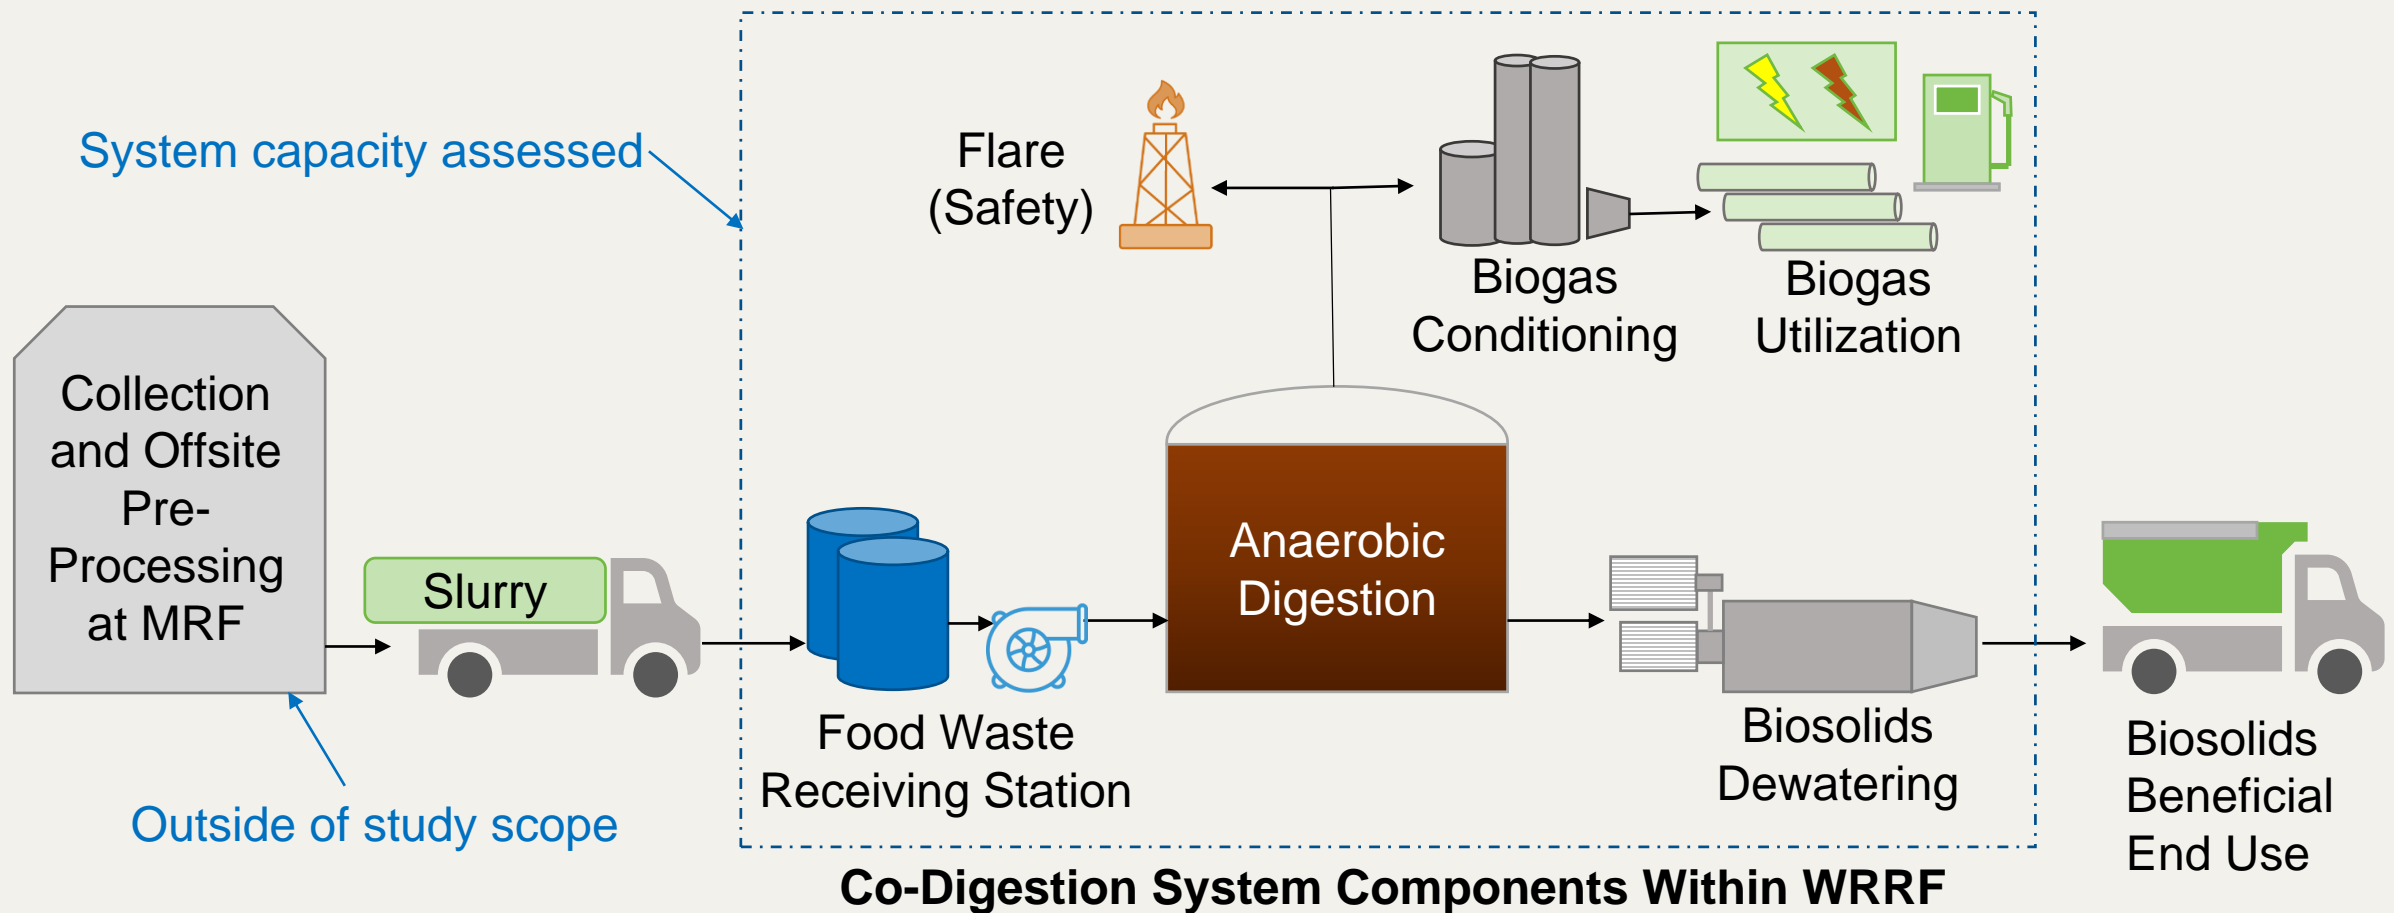

- Avoid over-estimating GHG reduction
- Allow for continued reduction in per capita disposal/recession
- Accounts for 50% recovery of digestible food waste

*Food waste comprises ~ 18% of MSW and 30% of total organics disposal, so diversion can play a major role in meeting the State's SB 1383 goals.*

# Chapter 2: Analysis of Existing Capacity for Co-Digestion

# What key processes are needed for co-digestion?

# Conducted comprehensive survey of CA WRRFs

- Survey focused on solids and biogas systems
- 99 of 223 WRRFs responded
- Comprised ~80% of state's total WRRF design flow capacity

# Compared current + projected loads to existing capacity to identify excess capacity in key processes

- Sufficient *digestion* capacity for most diverted food waste at 2030
- Overall capacity limited by other processes

**STATEWIDE EXISTING EXCESS CAPACITY FOR KEY PROCESSES**

# Chapter 3: Investments to Maximize Co-Digestion

# Summary of estimated costs illustrate potential WRRF investments required and annual O&M, revenue

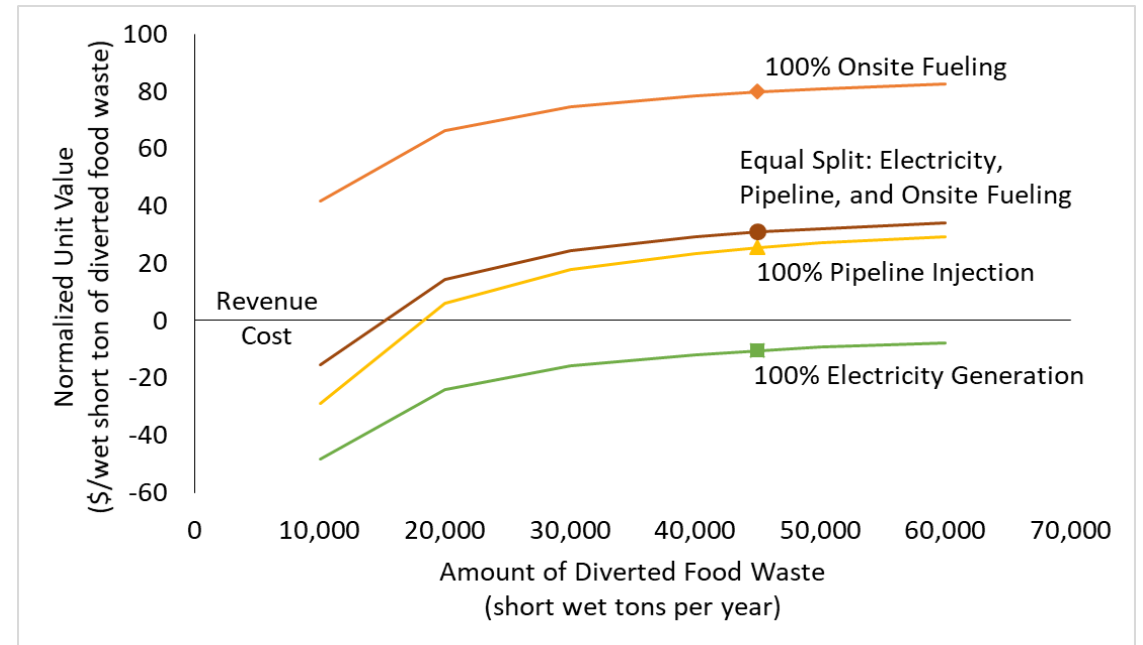

Case	Wet Tons Diverted Food Waste/Year	Coverage	Estimated Capital Cost, \$M	Estimated O&M Cost, \$M/Year	Estimated Revenue, \$M/Year	Biogas Use
Scenario 1	2,400,000	Statewide	968	97.6	278	Split
Scenario 2	3,400,000	Statewide	1,436	138	393	Split
Illustrative Facility	45,000	For Facility	22.4	1.8	7.3	CNG Vehicle Fuel

*Notes:*

- 1. Costs do not include collection of food waste, pre-processing at MRF, or fleet conversion.*
- 2. Capital costs represent planning level estimates, corresponding to AACE Class 5.*

# Conducted sensitivity analyses for biogas end use, facility size, and CNG/power prices

*Renewable energy incentives currently favor CNG/RNG and positive economic outcomes more likely for higher-capacity facilities.*

# Outlined regulatory considerations that could affect feasibility

## Water

## Air

## Land

# Chapter 4: GHG Emissions Reductions

# GHG emissions reduction from co-digestion of food waste could go a long way towards meeting the State's goals

Case	Wet Tons Diverted Food Waste/Year	Net Emissions Reductions Potential (MT CO <sub>2</sub> e)	
		Electricity Production	RNG Vehicle Fuel Production
Scenario 1	2,400,000	1,564,000	1,696,000
Scenario 2	3,400,000	2,210,000	2,397,000

***Diversion of food waste for co-digestion could reduce 1.6 to 2.4 million MT CO<sub>2</sub>e, up to 60% of the state's goal to reduce landfill emissions by 4 million MT CO<sub>2</sub>e by 2030.***

# Chapter 5: Co-digestion at Small / Mid-Sized WRRFs

# Case studies illustrate factors that facilitate implementation or pose barriers at smaller plants

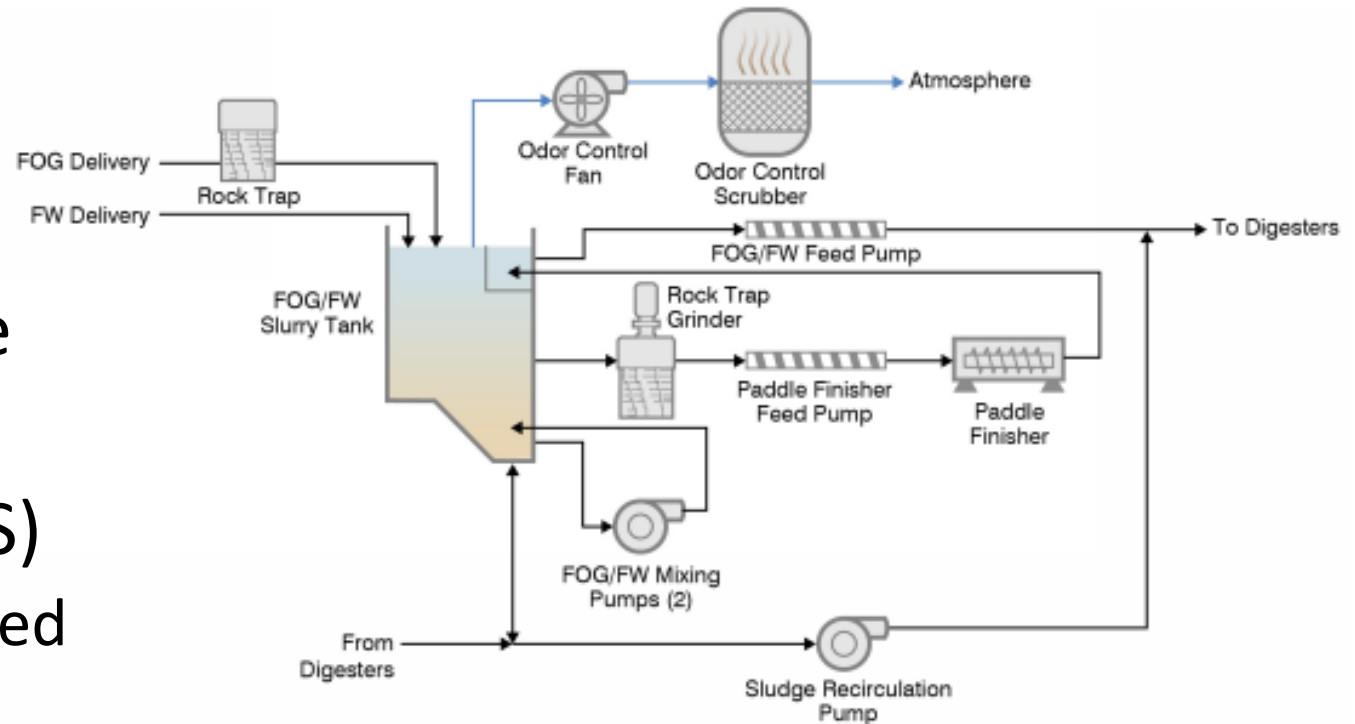

- Central Marin Sanitation Agency – 10 mgd
- Manteca Wastewater Quality Control Facility – 9.9 mgd
- Delta Diablo – 19.5 mgd
- Silicon Valley Clean Water – 29 mgd

# CMSA's Food to Energy (F2E) Program

- In Marin County
- Receive FOG, food waste slurry, food processing waste (started 2013-2014)
- Marin Sanitary Services (MSS)
  - Pre-consumer source-separated commercial food waste
- Biogas used for cogeneration
  - Working on modifications to export excess power to grid

# MSS collects, sorts, and processes food waste into slurry and trucks it to the plant

- 6-8 wet tons/day of 18% TS slurry delivered 6 d/wk to below-grade pit
- Mixed with thinner FOG received 5 d/wk at ~15,000 gpd
- Paddle finisher to polish
- Blend fed to digesters at ~7% TS

# CMSA Organic Waste Receiving Station

# CMSA Organic Waste Receiving Station

# Typical O&M activities are more than expected, but still worth it

- Costs (2018): \$216k
  - O&M
  - Administration
  - Supplies
- Revenues (2018): \$312k
  - FOG Tipping Fee
  - Food Waste Tipping Fee
  - Biogas Value

Frequency	Maintenance Activity
Daily	<ul style="list-style-type: none"> <li>• <b>Hose down equipment and receiving station</b></li> <li>• Rinse out pumps and piping</li> <li>• Clean out heavy object trap</li> </ul>
Weekly (or every other day)	<ul style="list-style-type: none"> <li>• Clean out pomace bins</li> <li>• Inspect and clean out rock trap grinder</li> <li>• Inspect equipment area</li> </ul>
Monthly	<ul style="list-style-type: none"> <li>• Check clearance on pumps and paddle finisher</li> <li>• Inspect bearing seals on pumps</li> </ul>
Every two months (on average)	<ul style="list-style-type: none"> <li>• <b>Replace hoses in hose pumps</b></li> </ul>
Quarterly	<ul style="list-style-type: none"> <li>• Clean receiving tank</li> <li>• Inspect coating on receiving tank</li> </ul>
Every six months or yearly	<ul style="list-style-type: none"> <li>• <b>Replace pump impellers if corroded</b></li> </ul>
Annually	<ul style="list-style-type: none"> <li>• <b>Replace pump impeller and housing</b></li> </ul>
Every 2 years	<ul style="list-style-type: none"> <li>• Siloxane media change-out</li> <li>• <b>Replace odor scrubber media</b></li> <li>• Replace biogas conditioning scrubber media</li> </ul>

# Lessons Learned

- Feedstock quality is important – a good partnership is invaluable
- Keep critical spare parts on hand – consider consequence of failure to identify and plan
- Critical to have organic waste coordinator with versatile skill set – from admin to logistics, lab/sampling, billing, and O&M
- Coatings fail and tanks are slippery – add cleats on floor
- Design well hatch covers to avoid bending

# Operational Impacts

- Dewatering required more polymer to achieve same cake dryness
- Biogas production and utilization needs balance – made operational changes to help equalize and avoid flaring
  - Sludge feed
  - Gas storage
  - Stop organic waste feed
  - Varying digester mixing speeds
- “Buffer” loads with sludge to digester

# What are the common factors facilitating co-digestion?

- State laws and regulations that drive change
- Supportive partnerships with waste management firms and utility providers
- Board/community support
- Robust planning/feasibility studies
- Financing assistance through loans/grants
- Revenue/cost offsets through tipping fees and biogas utilization

# What are the common barriers impeding co-digestion?

- Insufficient planning
- Regulatory hurdles – effluent, air, solid waste
- Inadequate funding and uncertainty about revenue
- Feedstock contamination
- Competition for organics diversion through composting and impacts on tipping fees

# Chapter 6: Co-digestion at Large WRRFs

# Case studies illustrate benefits and challenges associated with co-digestion

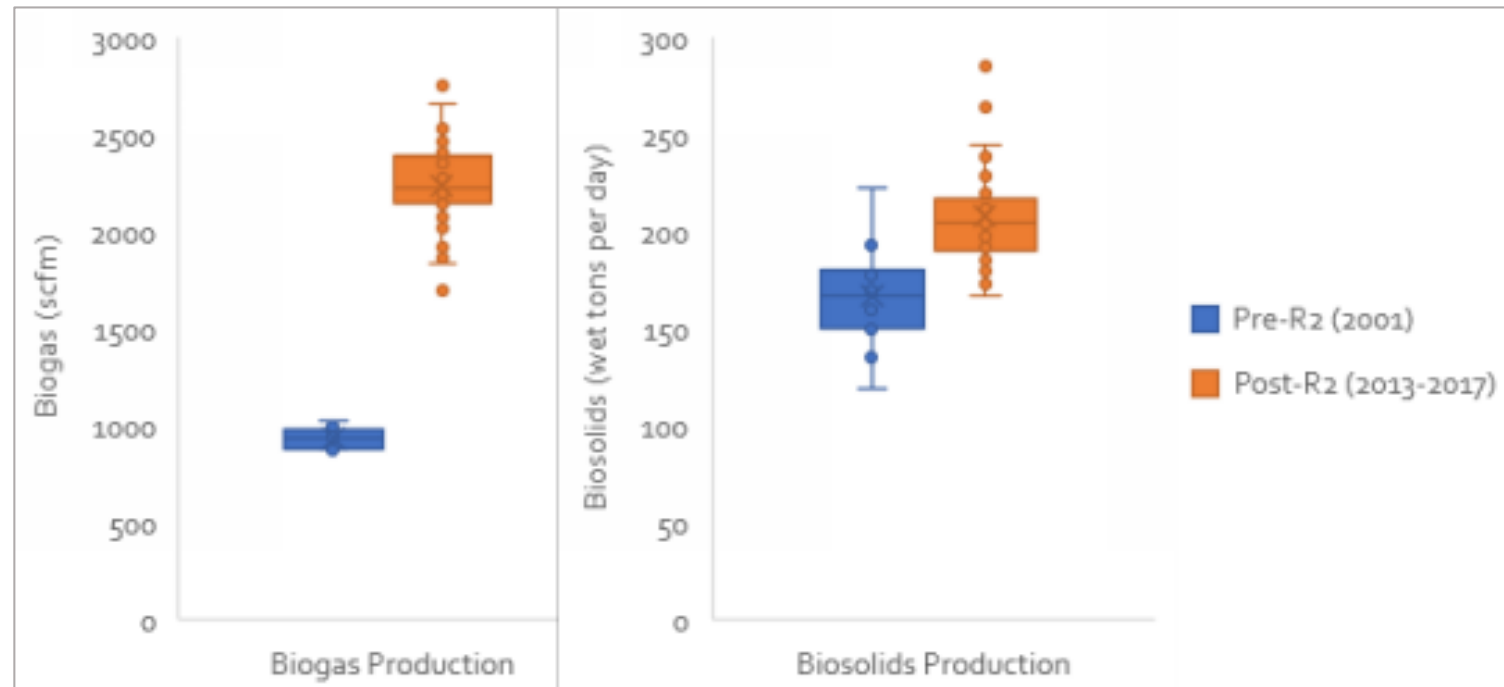

- Main Plant, East Bay Municipal Utility District (EBMUD) – 120 mgd

- Joint Water Pollution Control Plant, Sanitation Districts of Los Angeles County (LACSD) – 400 mgd

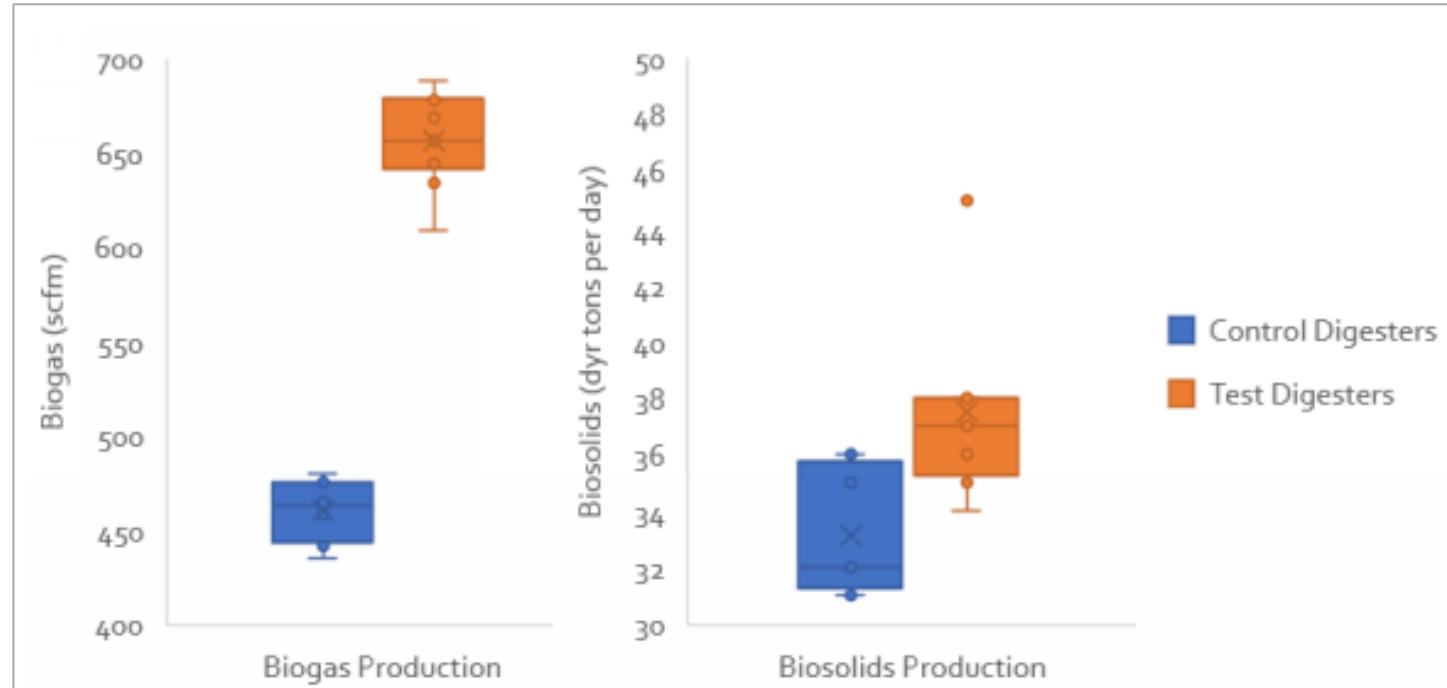

# EBMUD's R2 program produced tipping fee revenue and energy that exceeds added costs for biosolids

- 100-150 trucks/day with all R2 feedstocks
- Biogas (140%) and biosolids (25%) production increased
- \$3M/yr net revenue/cost offset
- Challenges: Grit, biogas variability, future utilization, future effluent limits

# LACSD conducted long-term demonstration of food waste slurry co-digestion to study impacts

- During demo, received up to 70 wet tons/day of bioslurry
- Four test/control digesters used
- Biogas (43%) and biosolids (13%) production increased
- Primary challenge during test: grit, glass and associated O&M
- Constructed pre-processing system at MRF
- Vehicle fueling system project underway
- Will construct larger slurry receiving station next

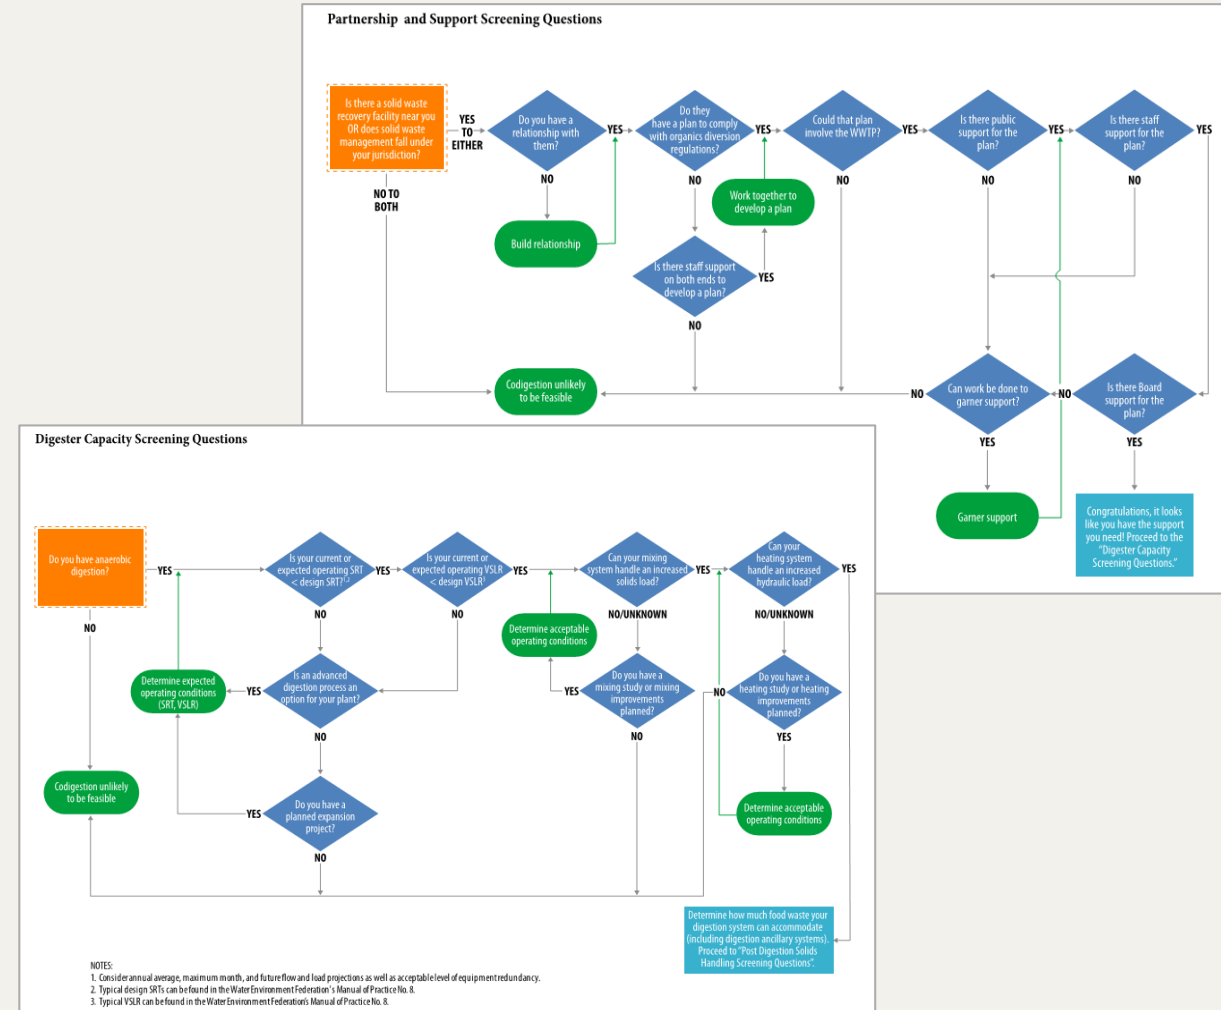

*Results represent data from September-November 2016*

# In Closing...

- Co-digesting food waste slurry at WRRFs can help achieve CA's mandates/goals if challenges & investment needs are addressed
- Feasibility of co-digestion and various biogas utilization options at the individual facility level requires case-by-case assessment

## DECISION SUPPORT TOOL

# Thank you to the project team, SWRCB, participating CA facilities, technical advisors / reviewers!

- Project Team
  - Elizabeth Charbonnet
  - Sarah Deslauriers
  - Chelsea Ransom
  - Rob Williams
- State Water Resources Control Board
  - Charlotte Ely
  - Max Gomberg
  - Jelena Hartman
- Facilities who participated in survey and case studies
- Technical reviewers and advisors
